## **ABSTRACT**

The technical world we live in today is in a constant state of advancement of technology and we are continually introduced to new innovative method of mediating information through online by the single click. Keyword job search is a very popular keyword, and surely everyone of us must also search for it. On the Internet there are many famous and reputable websites that help us find jobs that meet our needs such as Vietnamwork, Careerlink, timviecnhanh, topcv, 123job, .., most of these websites have The same functions as job search, company search, online application, companies can go here to find candidates for their company through their CV.

We are very interested in a system that can help users post recruitment news and find jobs. And we decided to challenge ourselves before stepping into the company's projects. We decided to create a similar system with the above functions and add some functions that we found useful and necessary, and specifically what those functions are in this report, we will cover it in detail.

The website system we are building is like a link between employers and people looking for work. The system provides functions such as job search through job title, industry and location keywords to help users search for jobs according to their needs. Users can search for companies and from there can view all the vacancies of that company. Companies can post jobs for their own companies, and manage those jobs. Then you can search for candidates for your company.

To accomplish this problem, all we need to do is survey the fact, collect requests from user groups. After collecting the requests we use Laravel Framework, MySQL, and a number of other technologies to implement the topic.

After a period of hard work, the system has completed all its functions as set targets, and is put into use. The system is put into practical use to help users conveniently in recruiting and looking for jobs.

The system has been put into use, however, the system is still new, so it takes time to improve, it is necessary to develop more interactive functions between users on the system.
